Not founder-approved · Not execution authority
Not a Constitution replacement

Frozen review candidate · Narrow clarification only · Sections 0–14

FounderGate Controlled Amendment 01 — Technical Proof, Cross-Account Evidence, Parallel Execution, and Deferred Commercial Validation

0. Status and Authority

Field	Value
Document type	Controlled Amendment Draft
Status	DRAFT FOR FOUNDER RECORDS
Founder-approved	NO
Execution authority	NO
Constitution replacement	NO
Repository write authorized	NO
Merge authorized	NO
Publishing authorized	NO
Scope	Narrow clarification only
Relationship to master Constitution	Proposed amendment / clarification, not a rewrite
Intended source filename	`FounderGate_Controlled_Amendment_01_DRAFT_FOR_FOUNDER_RECORDS.md`
Possible rendered record format	PDF, only after source text is frozen

This draft carries no authority of its own. It becomes governance only through the route the master Constitution already defines: durable capture, independent review, a founder gate, and Terminal-0 merge to the protected path. Nothing in this document authorises, accepts, activates, or merges anything.

1. Purpose

To record, in one place, the founder's clarified operating direction on four points:

1. Technical proof proceeds before market validation.
2. Market validation is not a blocker for technical beta completion.
3. Paid-customer proof is a later, founder-controlled commercial gate.
4. A founder-controlled second account may supply valid cross-account **technical** evidence — and may never be labelled as outside-customer validation.

The founder's framing: before selling a car, you prove the car drives, brakes, changes gears, survives controlled tests, and produces safety evidence. Market demand is tested afterwards. FounderGate proves the car works first — for the founder, on public repos, across accounts, through repeated controlled runs.

2. Scope of Amendment

In scope. Founder-clarified gate sequencing for this technical/commercial proof path; the cross-account evidence rule; the market-validation deferral rule; the parallel execution grid and lane separation; restatement of protected founder gates; claim discipline across the built-to-SaaS label ladder.

Out of scope. Any change to existing requirements, controls, gates, evidence classes, conflicts, clarifications, limitations, or source attributions in the master Constitution. This amendment adds no product requirement and removes none.

3. Founder Clarification

The founder rejects treating outside-user validation, real prospects, willingness-to-pay, or paid customers as blockers for the current technical proof phase.

The founder holds a separate GitHub / AKIOR account usable for separate project repositories. Work executed against that account produces evidence from disk, Git, exact commits, repository state, tests, and sealed evidence packages. The identity of the account owner does not weaken that technical evidence.

The founder further directs that such work must never be presented as outside-customer validation, independent market validation, paid-customer proof, or third-party design-partner proof.

4. Definitions

Term	Meaning
Technical proof	Evidence that a defined workflow executed as described, bound to exact commits and disk state, with tests, reports, and sealed evidence packages.
Founder technical proof	Technical proof produced on the founder's own primary project, operated by or for the founder.
Self-owned demo proof	Technical proof on a demonstration target the founder owns, used to exercise repo and objective flow under control.
Cross-account technical proof	Technical proof on a repository under a *different* founder-controlled account, including AKIOR. Proves portability across account boundaries. Proves nothing about customers.
Outside-person validation	A person who is not the founder, and not acting for the founder, using the product and reporting on it. Does not exist today.
Market validation	Evidence that people outside the founder's control want the product enough to adopt it. Does not exist today.
Paid-customer proof	A real payment, honestly recorded, for the product. May come from a friend, a small group, or a narrow market and still count — provided it is recorded as what it is. Does not exist today.
Commercial pilot	A founder-selected friend, prospect, or buyer using the product under founder-controlled conditions.
SaaS platform readiness	Proven hosted mechanics: auth, deployment, billing, support, repo access, data boundaries, security posture, operating controls. Not proven.

Term	Meaning
True founder gate	A decision the machine may not take: the next action is irreversible, live, spend-bearing, privacy-sensitive, or gate-changing.
Proven with limits	Proven for the exact scope tested, under the recorded conditions, and no further. The limits travel with the claim.

5. Founder-Clarified Gate Sequencing

This section records the founder's clarified **sequencing** of gates for the current proof path. It asserts no current verified state for any gate. Whether a given gate has been satisfied, and to what extent, is established by sealed evidence bound under §11 and rechecked at the time of use — not by this table.

Gate	Purpose	Sequencing treatment
1 — Founder Technical Proof	Prove FounderGate works for the founder	Current technical proof path
2 — Self-Owned Demo Proof	Prove controlled repo/objective flow on a self-owned demo target	Current technical proof path
3 — Public Demo Repo Readiness	Clean the demo repo for public release	Current technical proof path; publishing remains a protected founder gate
4 — Cross-Account Public Repo Proof	Prove operation on a repo outside the primary repository, including AKIOR or another founder-controlled account	Current technical proof path
5 — Non-Developer Founder Operation Proof	Prove the founder / non-developer operator can understand and use the evidence through a dashboard or local UI without reading code, operating terminals, or interpreting raw logs	Current technical proof path
6 — Repeatability / Crash-Test Proof	Multiple controlled tests across safe repos, objectives, and failure modes	Current technical proof path
7 — Real Provider / Cost-Controlled Proof	Expand bounded real-provider proof while preserving spend limits and authority gates	Current technical proof path; each run requires explicit founder authorization
8 — Founder-Controlled Commercial Pilot	Founder-selected friend, prospect, or buyer pilot, when the founder decides	Deferred commercial gate; not a blocker for Gates 1–7
9 — Paid Customer Proof	Prove payment; a real payment counts even from a friend, small group, or narrow market	Deferred commercial gate; not a blocker for Gates 1–7
10 — SaaS Platform Readiness	Prove hosted product mechanics	Foundation may proceed; SaaS readiness remains separately gated

Gates 8 and 9 are **deferred, not deleted.** Deferral is a sequencing decision by the founder. It does not convert an unproven thing into a proven one.

6. Cross-Account Evidence Rule

A repository under AKIOR or any other founder-controlled account **may** be used as valid technical evidence when the result is supported by exact commit identifiers, disk and Git evidence, test results, checker and advisor reports, and sealed evidence packages.

What cross-account proof establishes. That the workflow operates across an account boundary, on a repository outside the primary one, producing the same evidence discipline.

What it does not establish. Outside-customer validation. Independent market validation. Paid-customer proof. Third-party design-partner proof. Willingness to pay. Product-market fit.

Correct label, to be used without variation:

> *Cross-account, founder-controlled, public-repo technical proof.*

Rule. Any material describing cross-account work — internal, investor-facing, or otherwise — must carry that label. Substituting a customer-validation label is a claim-discipline breach, not a wording preference.

7. Market Validation Deferral Rule

Market validation, real-prospect contact, outside-user validation, willingness-to-pay evidence, and paid-customer proof are **deferred commercial gates**. They are:

- **not** blockers for Gates 1 through 7;
- **not** blockers for technical beta completion;
- **not** deleted, dismissed, or treated as unnecessary;
- **not** satisfied by anything a founder-controlled account produces.

Their absence must continue to be visible in any readiness statement. Deferring a gate does not lower the bar it sets when it arrives.

8. Parallel Execution Grid

The lane table describes future separately authorized work packages. It does not itself authorize file writes, repository writes, implementation, publishing, merge, provider spend, deployment, billing, outreach, or use of private/customer/production data.

Lanes A–H may proceed in parallel **only** under strict lane separation: each lane touches only its own files and stops at its own boundary. Where a lane's next step is a protected gate (§9), the lane stops and waits.

Lane	Work	Hard stop
A — Public Demo Cleanup	Remove internal docs; clean README and demo objectives; fix stale test-count language; add LICENSE; add `.gitignore`; run scans and tests	Stop before publishing
B — Cross-Account Repo Proof Prep	Prepare the AKIOR or separate-account public-repo proof plan; define safe-repo criteria	Stop before any external publishing or action unless separately authorized by the founder

Lane	Work	Hard stop
C — Founder No-Terminal UX	Define and, when separately authorized by the founder, build the local founder / non-developer operator journey: start, status, evidence, decision, export, without raw terminal dependence	No production deployment
D — Repeatability / Crash-Test Matrix	Prepare repeated test cases, failure cases, safe repos, and evidence criteria	Bounded to safe targets
E — Beta Spine Integration Map	Inventory PR #200 and branch-only work; identify what belongs in beta	Do not merge without founder authorization
F — Investor Evidence Map	Convert the current evidence ladder into an investor-safe proof story	Maintain claim discipline; no readiness claims
G — Founder-Controlled Commercial Pilot Prep	Draft pilot logic and the paid-proof definition	Do not send outreach without founder authorization
H — SaaS Foundation	Product brief; user roles; repo connection model; data policy; pricing hypothesis; billing design; security boundaries; hosted architecture sketch; deployment plan; optional non-production shell only	No live auth, billing, deployment, private or customer data, or production claims

Lane separation rule. Parallel work is permitted because these lanes are reversible, bounded, and non-live. Any lane that discovers it must touch a live path, a secret, a spend path, or a protected file stops and escalates rather than continuing.

9. Protected Founder Gates

The following remain true founder gates and may not be crossed automatically, by any lane, worker, or automation:

- public publishing;
- outreach to any person;
- real provider spend;
- founder key enrollment;
- merge to protected main;
- marking a PR ready;
- deployment;
- billing;
- private repository access;
- customer data;
- production data;
- security or compliance claims;
- final beta acceptance;
- commercial SaaS launch.

Nothing in this amendment weakens, batches, or pre-authorises any of these.

10. Claim Discipline and Label Separation

These labels are distinct and must never be collapsed into one another:

Label	Means	Does not mean
Built	Code exists	Tested
Tested	Named tests passed on named code	Independently checked
Checker-clean	An independent checker found no blocking defect on an exact candidate	Advisor-ready
Advisor-ready	A separate read-only advisor reviewed the same unchanged candidate	Founder-accepted
Pushed	Code reached a remote branch	Merged
Merged	Reachable on the protected path	Founder-accepted
Founder-accepted	The founder performed the accepting act at a gate	Published
Publicly published	Visible to people outside the founder	Used by anyone
Customer-used	A person outside the founder's control used it	Paid
Paid	A real payment occurred and was honestly recorded	Commercially ready
Commercially ready	Scored readiness, license/IP register, support model	Production ready
Production ready	A defined production-readiness checklist, risk review, and operating-readiness review have passed	SaaS ready
SaaS ready	Hosted mechanics proven end to end	—

Safe language.

- "FounderGate has proven controlled technical workflows under defined constraints."
- "FounderGate can use founder-controlled cross-account repositories as technical evidence."
- "Market validation is deferred and is not a blocker to the current technical proof path."
- "A real payment, even from a narrow market or friend, may count as paid-customer evidence if honestly recorded."

Forbidden language.

- "AKIOR proves outside-customer validation."
- "FounderGate is production-ready."
- "FounderGate is commercially proven."
- "FounderGate is SaaS-ready."
- "FounderGate is secure / compliant / certified."
- "Market validation is required before cross-account technical proof."
- "Outside-user validation blocks current technical completion."

11. Evidence References to Bind Before Reliance

This section does not assert current verified state. It identifies evidence categories that must be bound to exact sealed artifacts before the amendment is relied upon for an operational decision.

Evidence category	Artifact required before reliance	Notes
Level 4 autonomy / endurance	`[INSERT LEVEL 4 PROOF ZIP / SHA]`	Scope, duration, and conditions are established by the sealed package, not by this table
Evidence packaging	`[INSERT EVIDENCE PACKAGE REFERENCE]`	—
Checker and Gate Advisor flow	`[INSERT CHECKER / ADVISOR REPORT REFERENCE]`	Reports must bind to the exact candidate reviewed
Real-provider witness	`[INSERT REAL-PROVIDER WITNESS ZIP / SHA]`	Spend limits and authority gates apply to any further run
PR #203 beta-spine / live-wired evidence	`[INSERT PR #203 POST-MERGE RECEIPT / SHA, IF THIS ROW IS TO BE USED]`	No merge status is asserted by this amendment until the receipt is bound
Real non-sensitive project proof	`[INSERT REAL NON-SENSITIVE PROJECT PROOF ZIP / SHA]`	—
Self-owned demo rehearsal ladder (Obj1 / Obj2 / Obj3)	`[INSERT SELF-OWNED DEMO REHEARSAL ZIPS / SHAS]`	Each objective binds separately
Publish-readiness audit, self-owned demo target	`[INSERT PUBLISH-READINESS AUDIT ZIP / SHA]`	Any audit conclusion is read from the sealed artifact; publishing remains a protected founder gate
Investor / internal beta package	`[INSERT BETA PACKAGE REFERENCE]`	—
Concierge dry-run package	`[INSERT CONCIERGE DRY-RUN REFERENCE]`	—
Public publishing	`[NO ARTIFACT — NOT APPLICABLE UNLESS AND UNTIL A FOUNDER GATE IS CROSSED]`	Protected founder gate
Outreach	`[NO ARTIFACT — NOT APPLICABLE UNLESS AND UNTIL A FOUNDER GATE IS CROSSED]`	Protected founder gate
Paid customer proof	`[NO ARTIFACT — DEFERRED COMMERCIAL GATE]`	See §7
Production / SaaS / security / compliance readiness	`[NO ARTIFACT — SEPARATELY GATED]`	Claims in this category are forbidden without their own evidence; see §10

No row in this table transfers proof to an untested scope. A row becomes usable only when its artifact is bound, and each binding requires a fresh state check before use in a live decision.

12. Non-Goals

This amendment does **not**:

- approve publishing;
- approve outreach;
- approve provider spend;
- approve deployment;

- approve billing;
- approve private, customer, or production data access;
- approve merge;
- approve SaaS launch;
- replace the master Constitution;
- rewrite the 229-page document;
- resolve any open conflict or clarification;
- assert current verified state of any machine, repository, run, or account.

Sequencing note. If the master Constitution remains an unapproved candidate at the time this amendment is considered, the founder must decide whether this amendment waits for the next accepted Constitution edition, is folded into that edition, or stands alone as a founder-record clarification. This draft does not decide that sequencing question.

13. Reviewer Instructions

For the future independent reviewer. Verify that this amendment:

1. is narrow — it clarifies sequencing, labelling, cross-account technical-evidence treatment, market-validation deferral, and parallel-lane policy only;
2. does not rewrite, supersede, or contradict the master Constitution;
3. does not overclaim current product readiness anywhere;
4. protects every founder gate listed at §9, adding none and weakening none;
5. records market validation as **deferred, not deleted**, and keeps its absence visible;
6. labels AKIOR and other founder-controlled account work as cross-account technical proof, never as customer validation;
7. contains no fabricated evidence identifier — every reference at §11 is either a filled artifact reference or a visible placeholder;
8. keeps the parallel lanes at §8 bounded, reversible, and stopping short of every protected gate;
9. verify that no lane language accidentally authorizes implementation, publishing, merge, provider spend, deployment, billing, or customer/private/production data without a later explicit founder gate.

The reviewer must not edit the artifact under review. Any change after review begins invalidates the verdict and requires a fresh frozen artifact and a fresh review.

14. Founder Approval Placeholder

```
Founder approval status:            NOT APPROVED
Founder approval date:              _________
Founder approval statement:         _________
Reviewed draft PDF SHA-256:         268ab9bec34057ce598f80b24a50eb7e4e4e2948080c7da8d5bf5b74fd226f9d
```

```
Approved amendment SHA-256:          ________
Repository commit, if later adopted: ________
```

The reviewed-draft digest records which artifact the independent reviewer inspected. It does not indicate approval, and it will not match this review candidate, which supersedes the reviewed draft and requires a fresh digest and a fresh review.

Founder name note

The founder's canonical name is recorded as Yossi Wiseman in the founder decision record. This amendment uses "the founder" in the body to avoid reopening name/identity conflicts. This amendment does not reopen or resolve any unrelated identity conflict.

END OF DRAFT — DRAFT FOR FOUNDER RECORDS. Not approved. Not execution authority.
